“A classical quote goes here, setting the tone for the article that follows.”

— Author

Abstract

The abstract gives the reader a quick overview of what the article is about, what the central argument is, and why it is relevant. Two to four sentences is usually sufficient.

1 Introduction

The introduction states the problem and places it in context. Paragraphs are marked with indentation rather than line breaks, so the text forms a continuous flow. This is the classical typographic convention for printed articles and books.

A new paragraph continues with the same rhythm. References to prior work are made with a citation [1], and several sources can be combined within the same parentheses [1, 2].

2 Main Results

Mathematics is set either inline, as $E = mc^2$, or as a numbered equation:

$$\hat{H}\psi = E\psi. \tag{1}$$

Reference equations with (1) where it fits naturally in the text.

A new paragraph after an equation begins with indentation, just as elsewhere. The spacing between equation and body text is set to 0.5 cm in `classicstyle.sty`, so the mathematics breathes without detaching from the argument.

Figure 1: *An example figure. The [H] placement locks the figure exactly where it sits in the source, while [t] lets it float to the top of the page.*

Refer to figures in the text with figure 1. To summarize key values, tables can be useful:

Table 1: *Example of a table set with booktabs.*

Quantity	Symbol	Value
Speed of light	c	2.998×10^8 m/s
Planck’s constant	$\hbar$	1.055×10^{-34} Js
Elementary charge	e	1.602×10^{-19} C

Vertical lines are deliberately omitted, and horizontal lines are used sparingly — only top, middle, and bottom. This gives the table a calm, professional look.

3 Discussion

The discussion is where you interpret the results and place them in the context of existing literature. Here you can be more speculative than in the results section, as long as it is clear which arguments are your own and which are established findings.

Bullet lists are useful when several equally weighted points should be enumerated:

- The first point is stated here.
- A new point follows on the next line.
- A third point closes the list.

For numbered sequences or step-by-step reasoning, use numbered lists:

1. The first step in the reasoning.
2. The second step, building on the first.
3. The third step leads to the conclusion.

Note

Colored boxes are useful for highlighting definitions, observations, or warnings. The `tcolorbox` package offers many design options — see its documentation for the full set.

3.1 A Subsection

Subsections get their own heading but keep a calm typographic weight, so the main sections still dominate the hierarchy.

4 Conclusion

The conclusion summarizes briefly, points toward open questions, and suggests further work where relevant. A final paragraph rounds off the article without introducing new arguments.
